

1 (a). Answer

$$i. \quad EQA = \sqrt{\frac{2AB}{C}} = \sqrt{\frac{2 \times 60000 \times 800}{1.5}} = 8000 \text{ units}$$

Where A=60000, B=800, C=10*15%=1.5

$$ii. \quad \text{Re order level} = \text{Safety stock} + \text{lead time consumption} = 600 + 2000 = 2600 \text{ units}$$

Where lead time consumption = 10 days * Average consumption per day = 10 * 60000 / 300 = 2000 units

$$iii. \quad \text{Maximum stock level} = \text{ROL} + \text{ROQ} - (\text{Minimum consumption per day} \times \text{minimum re order period})$$

$$= 2600 + 8000 - (60000 / 300) \times 10 \text{ days} = 2600 + 8000 - 2000 = 8600 \text{ units}$$

Note: As there is no information about minimum consumption & minimum reorder period, Average consumption per day & lead time was taken

$$iv. \quad \text{Average stock level} = \text{EOQ} \times 1/2 = 8000 / 2 = 4000 \text{ units}$$

1 (b) Answer

i.	WIP control a/c Dr	325000	
	FOH control a/c Dr	115000	
	To Stores ledger control a/c Cr		440000
ii.	WIP control a/c Dr	487500	
	FOH control a/c Dr	162500	
	To Wages control a/c Cr		650000
iii.	FOH control a/c Dr	250000	
	To Over Absorption a/c Cr		250000
	Under Absorption a/c Dr	175000	
	To Administration control a/c Cr		175000
iv.	Sundry creditors a/c Dr	150000	
	To Bank/Cash a/c Cr		150000
v.	Bank/Cash a/c Dr	200000	
	To Sundry Debtors a/c Cr		200000

2(a) Answer

Particulars	Computations	Rs
Depreciation	$= (1800000 - 120000) * 1/15 * 1/12$	9333.33
Insurance charges	$= 1800000 * 3\% * 1/12$	4500
Manager cum accountant salary	Given	8000
Annual tax	$= 50000/12$	4166.66
Garage rent	Given	2500
Annual repairs and Maintenance	$= 150000/12$	12500
Drivers salary	Given	15000
Conductor salary	Given	12000
Stationery	Given	500
Engine oil, lubricants..	$= (20\text{km} * 3 * 2 * 25\text{days}) * 2500/1200$	6250
Diesel and oil	$= (20\text{km} * 3 * 2 * 25\text{days}) * 52/10$	15600
Total cost excluding driver commission	75%	90350
Driver commission	10%	12046.67
Total cost	85%	102396.67
Profit	15%	18070
Revenue(collection)	100%	120466.7

Total cost excluding driver commission = 75% ----- 90350

Total collection = 100% ----- ?

Total collection = $90350 * 100/75 = 120466.7$

Passenger km = $20\text{km} * 3 * 2 * 40\text{passengers} * 25\text{days} = 120000\text{Passengers km}$

$$\text{Fare} = \frac{\text{Total collection}}{\text{Passenger km}} = \frac{120466.7}{120000} = 1.003 \text{ per passenger km}$$

3(a) Answer

i. Labour T/O under separation method = S/L

5% = 40/L

Where, number of separations = 40

Average Labour force (L) = $40/5\% = 800$

ii. Labour T/O under replacement method = R/L

8% = R/800

$$\text{Replacements(R)} = 800 \times 8\% = 64$$

$$\text{iii. Labour T/O under FLUX method} = (S+A)/L$$

$$13\% = (40+A)/800$$

$$40+A = 800 \times 13\% = 104$$

$$\text{Accessions} = 104 - 40 = 64$$

iv. We know that accessions = Number of workers at the end + Number of separations – Number of workers at the beginning

In this case we don't know no. Of workers at the beginning & end, so let's take

No. Of workers at the beginning = X

No. Of workers at the end = Y

Accessions = 64

Separations = 40

By taking all the values in the above equation

$$64 = Y + 40 - X$$

$$Y - X = 24 \dots\dots\dots 1$$

We know that average labour in force = (No. Of workers at the beginning + No. Of workers at the end) / 2

$$800 = (X + Y) / 2$$

$$Y + X = 1600 \dots\dots\dots 2$$

By solving the above 2 equations

$$Y = 812, X = 788$$

No. Of workers at the beginning = 788

4(a) Answer

$$\text{i. Material usage variance} = \text{SPSQ} - \text{SPAQ} = 45 \times 9000 \text{Kg} - 45 \times 8900 \text{kg} = 100 \text{kg} \times 45 = 4500 \text{F}$$

Computation of SQ

Standard for one packet (10kg) -----10kg

Standard Quantity for actual output of 9000kg=?

SQ=9000kgs but actual consumption is 8900kg, so 100kg saved

Material Usage variance = $100\text{kg saved} \times 45 = 4500$ Favorable effect

- ii. Material price variance = $\text{SPAQ} - \text{APAQ} = 45 \times 8900 - 46 \times 8900 = 8900\text{A}$
- iii. Material cost variance = $\text{SPSQ} - \text{APAQ} = 45 \times 9000 - 46 \times 8900 = 4400\text{A}$
- iv. Labour efficiency variance = $\text{SRSH} - \text{SRAH} = 50 \times 7200 - 50 \times 7000 = 10000\text{F}$

Computation of SH

Standard hours for 10kg out = 8 hours

Standard hours for 9000kgs output = ?

$\text{SH} = 9000 \times 8/10 = 7200$ hours but actual taken is 7000 hours, so here time saved due to more efficiency, so favourable effect

- v. Labour rate variance = $\text{SRAH} - \text{ARAH} = 50 \times 7000 - 52 \times 7000 = 14000\text{A}$
- vi. Labour cost variance = $\text{SRSH} - \text{ARAH} = 50 \times 7200 - 52 \times 7000 = 4000\text{A}$
- vii. Variable OH cost variance = $\text{Absorbed VOH} - \text{actual VOH} = \text{SRSH} - \text{Actual VOH} = 10 \times 7200 - 72500 = 500\text{A}$
- viii. Fixed OH cost variance = $\text{Absorbed OH} - \text{Actual OH} = 9000 \times 200/10 - 192000 = 180000 - 192000 = 12000\text{A}$

Computation of Absorbed FOH

Standard recovery rate per kg of output = $200/10 = 20$ per kg

Absorbed = $\text{Actual output} \times 20 \text{ per kg} = 9000 \times 20 = 180000$

6(a) Answer

Particulars	Computations	Rs
Depreciation	$(25,00,000 - 1,25,000) \times 3,000 / 25,000$	2,85,000
Power	Working note no. 1	3,25,000
Cost of repairs & maintenance	Given	26,000
Chemical cost	$2,600 \times 12$	31,200
Overhead charge	$18,000 \times 12$	2,16,000
Insurance	$25,00,000 \times 2\%$	50,000
Operator salary	$(18,500 \times 12 \times 2)/3$	1,48,000
Total Cost		10,81,200
Effective working hours	Working note no. 1	2,407.41 Hours

$$\begin{aligned} \text{Machine hour rate} &= \frac{\text{Total Cost}}{\text{Effective working hours}} \\ &= \frac{10,81,200}{2,407.41} = 449.11 \text{ per hour} \end{aligned}$$

Working note no.1

Total working hours per annum = 3000

Maintenance hours = 400

Working hours including set up time = $3,000 - 400 = 2,600$

Set up time = 8% of actual working hours

Lets take Actual working hours = 100

Set up time = $100 * 8\% = 8$

Working hours including set up time = 108

Set up time = $2,600 * 8/108 = 192.59$ hours [108.....8 ; 2,600.....?]

Therefore effective working hours = $2,600 - 192.59 = 2,407.41$ hours

Power cost = $2,600 \text{ hours} * 25 \text{ units} * 5 \text{ per unit} = 3,25,000$

Notes:

- 1. It was assumed that working hours are inclusive of maintenance hours & Set up time**
- 2. power is required during set up time**

NOTE: Dear students, Verify the solutions and let us know any queries/corrections to be made
