INTRODUCTION:

SPAM!

Don't you just hate it?

You turn on your computer, connect to the internet, open up your Outlook Express and, hey presto! Your inbox fills up with a truckload of unsolicited emails, offering products and services that you just don't want or need!

It's bad enough being cold-called by telephone sales people, but now you're getting it from your computer too!

Sure enough, every day they darken your computer screen with adverts about viagra, mortgages, loans, breast and penis enlargements, porn and anything else they can throw at you!

More often than not, the same emails fall into your inbox several times a day from different spammers.

It's as if there's a whole gang of them, all in cahoots!

OK, so email clients like Hotmail and Yahoo have spam filters already built in to enable you to shift the spam, but, for some reason, your very own Outlook Express continues to lack any kind of filtering software.

Don't you wish there was a way to automatically delete all the crap?

But hold on!

There is a way!

By making a few simple adjustments to the configuration of Outlook Express, you can breathe a sigh of relief while you wave goodbye to the majority of these cyber salesmen.

By applying these simple methods, hundreds of unwanted emails will be deleted from your inbox without you even noticing!

HOW TO DO IT:

OK, firstly, open Outlook Express and click on **Tools** from the top list.

Select **Message Tools** and then select **Mail**.
A window called **Message Tools** will appear.

Click on **New**.

A new window called **New Mail Rule** will then appear, looking like the picture below.

Tick the checkboxes **Where the Subject Line**

contains specific words and **Where the message body contains specific words** in the **Conditions** box like in the picture below.

You then write the name of the message rule in the **Name of the rule** field as shown in the above picture. You can call it what you like. I have called it **Spam Filter**.

You will see that, in the picture above, text and links have appeared in the **Rule Description** box.

Ignore these for now. We will cover these in a moment.

You then tick the checkboxes **Delete It** and **Highlight**

it with **color**, like in the picture below.

OK, now click on the **color** link.

A small box will appear with a drop box of colours like in the picture below.

I always select **Red**. I suggest you do the same.

I'll tell you why in a moment.

After selecting the colour, click on **OK**.

The box will then disappear.

After that, click on the **Where the Subject line contains specific words** link.

A box will appear where you can enter words that will trigger your spam filter like in the picture below.

To gather a list of spam words, all you have to do is check your spam emails.

My guess is that you have received several spam emails in the short time that you have been reading this book.

Look at the text in your spam emails and find words that are only contained in spam, such as mortgage, viagra, penis and porn, etc.

Once you have a list of spam words, type them into the top field **ONE AT A TIME** and click on **Add** each time. **DON'T** type them all in at once.

You will then see a list of your spam words in the

bottom box, like in the picture below.

Once you have finished, click on **OK**.
Your New Mail Rule box will now look like this.

You now click on the **Where the message body contains specific words** link.

A box will appear where you can enter words that will trigger your spam filter like in the picture below.

Do the same as you did with the Subject box and load in your spam words.

Once finished, click on **OK**.

Your New Mail Rule box will now look like the picture below.

You can load in as many spam words as you like.
Once finished, click on **OK**.

And that's it!

Your spam filter has now been set up and will now run automatically in the background.

Basically, when new emails arrive, if the spam filter finds an email containing any of your spam words, the email will be deleted as soon as it arrives and will be sent straight to the **Deleted Items** folder of your Outlook Express.

Now and then, it is best to check your Deleted Items folder, just in case your spam filter has deleted emails from friends. (as sometimes they may have typed words that match your spam words in their text)

You'll easily be able to see the emails that the spam filter has deleted as they will be highlighted in red, which is why I suggested this colour earlier on.

If you ever want to edit your spam filter, simply click on **Tools** from the top list, select **Message Tools** and select **Mail**. Then select **Spam Filter** and click on **Modify**.

See? Easy, wasn't it?

So, let me finish up here by saying thanks for purchasing this ebook.

And be sure to search the internet for more ebooks written by me!

Warm regards, Mikey J.
